March 2026 |

DATA SET DESCRIPTION

This dataset contains the monthly median value of bank evaluation per square meter (EUR/m²) for the municipality of Porto, Portugal. The data source is the National Institute of Statistics of Portugal (INE), specifically the Survey on bank evaluation on housing. As a monthly time series, the dataset follows a regular chronogram with 12 observations per year, as shown in Figure 1. The first available observation is January 2011 and the last is February 2026, resulting in a total of 182 observations.

Figure 1 - Median value of bank evaluation (€/m²), in Porto, from January 2011 to February 2026

MAIN CHARACTERISTICS

A first visual inspection of the series indicates an upward long-term trend, particularly in the second half of the sample. The data displays temporal persistence, as successive observations tend to evolve smoothly over time. This is consistent with the ACF plot (Figure 2 – left panel), which shows positive autocorrelations that decay gradually, and with the PACF plot (Figure 2 – right panel), which is dominated by the first lag.
